

FUTURE OF FIGHTING TERMITES

TERMIDOR® HP11

HIGH PRECISION INJECTION SYSTEM

Technology is constantly advancing, enhancing our lives every day. The newest technology in termite treatment, Termidor HP11 High Precision Injection System, is changing the way we treat for termites. The days of destructive and unreliable treatments are in the past.

This guide introduces you to the most effective, efficient, and revolutionary product in termite treatment, HP11. We'll describe the product, how it's used, its benefits, and compare it to other treatment methods.

This innovative and groundbreaking treatment has just come to Georgia, and Breda Pest Management is the only company offering the advantages of HP11 for Georgia homes.

NEW INNOVATIVE TREATMENT

Termidor HP11 High Precision Injection System is a vertical hydraulic treatment that is injected from atop the soil/surface at approximately 4000 psi and creates a uniform 12 inch treatment zone. Each zone is treated with Termidor termiticide, a proven performer for more than 16 years. The uniform, complete treatment is done throughout the entire yard, or desired treatment area.

As with other Termidor products, the treatment is only required once every 10 years, unless additional termite activity is found during the 10 year period. In three months or less after treatment, you can expect 100% termite control. Few other treatment plans can guarantee you a complete elimination of the termite colony threatening your area.

CLOSER LOOK AT THE CHEMICAL INTERACTION

You don't have to be a chemist to understand that this product works! Termidor HPII is referred to as a non-repellent, meaning termites will enter the barrier unaware they have picked up the chemicals. This transfer method allows them to pick up and carry it back to their colony, thereby spreading the deadly chemical amongst one another through their grooming process (rubbing against each other).

In about three months, the chemical will make it all the way through the different social casts of the colony, and finally to the queen for total colony elimination. This makes HPII 100% effective in eliminating the problem and the source. Since the treatment is below soil grade, it is extremely effective at killing termites, but completely harmless to family members, animals, and important pollinators, such as bees.

THE BENEFITS THAT HP11 IS OFFERING YOU

We care about giving you the best experience and treatment possible, so when we say this is the best treatment in the industry, we mean it. There are many benefits of using the HP11 treatment for your termite problems.

There is no digging, trenching, or rodding required around your home; application sites remain virtually unseen. **This treatment doesn't disturb or destroy your yard.**

It should take about an hour for the treatment to be complete, so we won't be in your space all day.

You can count on the treatment to work. To ensure accuracy and consistency, the Termidor HP11 Injection System is equipped with an advanced digital onboard computer that prevents over or under usage of the product by providing treatment readings within a tenth of an ounce.

Termidor HP Injection system is revolutionizing the industry and will make all other treatment methods obsolete.

TERMIDOR HP INJECTION SYSTEM VS. BAITING

One of the more common treatment options is known as baiting. You may have used this in the past, or currently use it, but the Termidor HPII treatment offers many more benefits.

Structures treated with Termidor have less than a 1% retreat rate nationwide, it's that good. Retreat rates vary with the wide variety of baiting and monitoring station systems, but national statistics are higher. Statistically, Termidor HPII treatments are far more effective.

As with all previous Termidor products, HPII only needs to be applied once every 10 years and only requires one inspection per year. In comparison, bait stations typically require inspections 1-4 times per year and product/baits need to be continually added as needed throughout the time that they are installed and monitored.

Baiting stations are placed out in the open yard, approximately every 10 feet and can be considered an eyesore. Ditch the bait stations with the Termidor HPII treatment that has no visible impact or foot print left behind in the yard. Keep your yard looking fresh and your home free of termites.

Due to the need to inspect, monitor, and refill baits, along with their higher retreat rates, their renewal rates tend to be quite a bit higher than the renewal rates of Termidor HPII. Breda Pest Management's annual renewal rate is currently a locked in rate of \$195 a year (after the first year's treatment) for a total of 10 years. Sticking with and renewing a baiting treatment can cost you upwards of \$300, depending on how many stations are in place.

Over a 10 year period at Breda Pest Management, our retreatment rate is less than 0.5%

TERMIDOR HP INJECTION TRADITIONAL LIQUID

If you are familiar with traditional liquid treatments you know how long the process takes and how disruptive it can be to your yard. With Termidor HPII, you no longer have to worry about heavy equipment tearing up your yard and landscaping.

No trenching is required with the High Precision Injection System, and the product can also treat around concrete slabs such as patios, walkways, and garage floors without the need for drilling. Drilling may only be necessary in extreme cases to ensure termite elimination.

This new treatment system is designed to create an even more complete, uniform treatment zone, known as “High Termite Activity Zones”, which treats what traditional rodding and trenching methods would have covered.

There is no room for error in this process due to the high-tech onboard computer. The Termidor HPII Injection System mixes the product and water via the computer for an exact measurement of mixture each application. Traditional liquid products are mixed by the technician and must properly measure product and water levels accurately to get a properly mixed final solution. Safety levels for both traditional rodding and trenching methods and HPII are similar. However, using HPII will eliminate all room for human error.

HOW TO KEEP TERMITES OUT FOR GOOD

Now that you understand the benefits that of the Termidor HPII High Precision Injection System, we hope you'll consider improving your next termite treatment experience by having the experts at Breda Pest Management treat your home with HPII.

By switching to the HPII treatment you will be saving money, your yard, and your home. HPII is a substantially better treatment that requires less maintenance and upkeep than other traditional treatments. Don't destroy your yard with outdated rodding and trenching techniques or unpleasant bait stations. HPII has revolutionized the industry, so it's time for you take advantage of the advancements that have been made.

At Breda Pest Management, our team of licensed and certified pest control professionals have provided residents across the state of Georgia with safe and effective pest control for decades. No matter what pest is bugging you, we've got the tools and the know-how to keep it out of your house for good.
